Evening Brief

Date: Saturday September 26th, 2020

Weather Summary

Temperatures will be five to ten degrees below normal across all but the southern Great Basin this afternoon in the wake of a cold front. Breezy north winds are expected across much of the area, with wind gust in the 15 to 20 mph range. However, portions of southern Utah will see gusts to 30 mph, leading to isolated critical fire weather conditions.

Conditions will begin to warm and dry on Monday as upper-level high pressure begins to build over the area. This warming and drying trend will intensify throughout the week across the Great Basin, with temperatures reaching near-record levels by the end of the workweek.

Preparedness Levels & Great Basin Fire Activity (from WFDSS)

Great Basin	PL 4	Light Initial Attack Activity
National	PL 5	New Fires and Acres: 6 fires for 4.7 acres. 176 acres Large Fire Growth

Fuels/Fire Potential

Recent moisture and cool temperatures across northern and eastern areas have raised fuel moisture temporarily. ERC's, which just a few days ago were at record dry levels across Idaho, Wyoming and eastern Utah, have rapidly fallen back to near late September normals.

Otherwise, fuels will remain critical over most of the southern half of the Great Basin under drier conditions. Light precipitation across Central Idaho into western Wyoming could raise fuel moisture even more by Friday/Saturday.

Live Fuel moisture in low elevation brush remains critically dry, between 60-100% in most areas, which correlates with extreme fire behavior.

In the long range, much above normal temperatures and very dry conditions by the end of the weekend into next week will bring about more rapid drying of fuels in most areas across the Great Basin. Fuels in the Western half of the Great Basin could once again reach near record level dryness.
